COLORLESS DETERGENT COMPOSITIONS WITH ENHANCED STABILITYTECHNICAL FIELD

This invention relates to stable, colorless detergent compositions containing anionic and/or nonionic surfactant, oxygen bleach and metal sequestering agent.

SUMMARY

The present invention relates to a colorless detergent composition comprising:

(a) from about 5% to about 95% by weight of anionic or nonionic surfactant;

(b) from about 0.005% to about 10% by weight of oxygen bleach; and

(c) from about 0.001% to about 8% by weight of metal sequestering agent;

wherein the composition has a pH between about 4 and about 11, and a transmittance at 470 nm. of greater than about 85%.

This composition exhibits good stability over time and under harsh temperatures.

BACKGROUND INFORMATION

Detergent compositions for performing a wide variety of household and industrial cleaning operations are known in the art and are formulated for optimized performance under the contemplated end use conditions. See for example U.S. Patents 4,555,360, Bissett et al, issued November 26, 1985; 4,435,317, Gerritsen et al, issued March 6, 1984; 4,681,704 Bernardino et al, issued July 21, 1987; 4,316,824, Pancheri, issued February 23, 1982; 4,904,359, Pancheri et al, issued February 27, 1990; 4,133,779, Hellyer et al, issued January 9, 1979, and 4,678,606, Akhter et al, issued July 7, 1987. Along with optimized performance, a product which after storage is stable and aesthetically pleasing is desirable. It is especially difficult to achieve a stable colorless detergent composition.

WO 93/14183

PCT/US93/00185

- 2 -

It is possible to develop a clear detergent product; however, detergent ingredients such as anionic surfactants and suds boosters cause product yellowing or darkening over time. Dyes are often added to the compositions to compensate for this discoloration.

It has been found that a stable colorless detergent composition can be attained by adding certain amounts of oxygen bleach and metal sequestering agent to anionic and/or nonionic surfactant.

DESCRIPTION OF THE INVENTION

The present invention encompasses detergent compositions which are stable and remain colorless over time, even under harsh temperatures. These detergent compositions contain three essential components:

(1) from about 5% to about 95% by weight of anionic and/or nonionic surfactant;

(2) from about 0.005% to about 10% by weight of oxygen bleach; and

(3) from about 0.001% to about 8% by weight of metal sequestering agent.

Optional ingredients, especially suds boosters, can be added to provide various performance and aesthetic benefits.

These components provide a substantially colorless detergent product which does not darken or yellow under normal to harsh conditions to which a detergent composition would be exposed. Without these components, especially if anionic surfactant and suds booster are present, the product can be yellow initially and with time can become even more discolored.

Surfactant

The compositions of this invention contain from about 5% to about 95% by weight, preferably from about 10% to about 65%, most

PCT/US93/00185

preferably from about 15% to about 35%, of an anionic and/or nonionic surfactant.

Preferred anionic synthetic detergents which can form the surfactant component of the compositions of the present invention are the sodium, ammonium, potassium or magnesium alkyl sulfates, especially those obtained by sulfating the higher alcohols (C₈-C₁₈ carbon atoms) sodium or magnesium alkyl benzene or alkyl toluene sulfonates, in which the alkyl group contains from about 9 to about 15 carbon atoms, the alkyl radical being either a straight or branched aliphatic chain; sodium or magnesium paraffin sulfonates and olefin sulfonates in which the alkyl or alkenyl group contains from about 10 to about 20 carbon atoms; sodium C₁₀-20 alkyl glyceryl ether sulfonates, especially those ethers of alcohols derived from tallow and coconut oil; sodium coconut oil fatty acid monoglyceride sulfates and sulfonates; sodium, ammonium or magnesium salts of alkyl phenol ethylene oxide ether sulfates with about 1 to about 30 units of ethylene oxide per molecule and in which the alkyl radicals contain from 8 to about 12 carbon atoms; the reaction products of fatty acids esterified with isethionic acid and neutralized with sodium hydroxide where, for example, the fatty acids are derived from coconut oil; sodium or potassium salts of fatty acid amides of a methyl tauride in which the fatty acids, for example, are derived from coconut oil and sodium or potassium beta-acetoxy or

Janv2html?FI ENAME-%2Fcache%2F82%2FA1%2FEM/000214102A1:FILE.DACE-50:UCED:UTM: 0204:UNDEF020000000000

WO 93/14183

PCT/US93/00185

- 5 -

useful in the present invention are condensation products of ethylene oxide and monohydric alcohols having from about 10 to about 20 carbon atoms. Preferably, R has 10 to 16 carbon atoms. The alcohols can be derived from natural fats, e.g., coconut oil or tallow, or can be synthetic. Such alcohols are reacted with 1 to 30, and especially 1 to 12, molar proportions of ethylene oxide and the resulting mixture of molecular species is sulfated and neutralized.

Specific examples of alkyl ether sulfates of the present invention are sodium coconut alkyl triethylene glycol ether sulfate, magnesium C₁₂₋₁₅ alkyl triethylene glycol ether sulfate, and sodium tallow alkyl hexaoxy ethylene sulfate. Preferred alkyl ether sulfates are those comprising a mixture of individual compounds, said mixture having an average alkyl chain length of from about 12 to 16 carbon atoms and an average degree of ethoxylation of from about 1 to 12 moles of ethylene oxide.

Additional examples of anionic surfactants useful herein are the compounds which contain two anionic functional groups. These are referred to as dianionic surfactants. Suitable dianionic surfactants are the disulfonates, disulfates, or mixtures thereof which may be represented by the following formula:

where R is an acyclic aliphatic hydrocarbyl group having 15 to 20 carbon atoms and M is a water-solubilizing cation, for example, the C₁₅ to C₂₀ disodium 1,2-alkyldisulfates, C₁₅ to C₂₀ dipotassium-1,2-alkyldisulfonates or disulfates, di-sodium 1,9-hexadecyl disulfates, C₁₅ to C₂₀ disodium 1,2-alkyldisulfonates, disodium 1,9-stearyl disulfates and 6,10-octadecyldisulfates.

Suitable alkyl ethoxy carboxylates of the present invention have the generic formula $\text{RO}(\text{CH}_2\text{CH}_2\text{O})_x\text{CH}_2\text{COO}^-\text{M}^+$ wherein R is a C_{12} to C_{16} alkyl group, x ranges from 0 to about 10, and the ethoxylate distribution is such that, on a weight basis, the amount of material where x is 0 is less than about 20%, preferably

PCT/US93/00185

- 6 -

Fatty acid ester sulfonates of the present invention are of the formula:

20 Suitable surfactants of the present invention also include the alpha-sulfonated fatty acid alkyl ester of the formula

30 Particularly preferred nonionic surfactant of the present invention is selected from the group comprising alkyl polyglucoside, alcohol ethoxylated with from about 1 to 30 moles of ethylene oxide per mole of alcohol, polyhydroxy fatty acid amide, and mixtures thereof.

WO 93/14183

PCT/US93/00185

- 7 -

Suitable nonionic surfactants of the present invention include the ethoxylated nonionic surfactants. These include the condensation product of alcohols, alkyl phenols and other specified hydrophobic molecules with ethylene oxide of the formula

wherein R is an aliphatic hydrocarbyl radical containing from about 1 to about 30 carbon atoms, wherein n is from about 10 to about 100. Examples of alternate ethoxylated nonionic surfactants are:

- (1) an ethoxylated alkyl phenol of the formula $R(OC_2H_4)_nOH$ wherein R is an alkyl phenyl radical containing a total of from about 18 to about 30 carbon atoms and at least one alkyl group containing at least about 12 carbon atoms wherein n is from about 16 to about 100;
- (2) the condensation product of mono C16-22 fatty acid esters of polyglycols with from about 13 to about 100 moles of ethylene oxide per mole of partial ester;
- (3) the condensation product of cholesterol and from about 13 to about 100 moles of ethylene oxide;
- (4) a material which is a condensate of ethylene oxide, propylene oxide and a compound containing hydroxy or amine groups onto which the alkylene oxides can be polymerized, said polymer having a molecular weight of from about 500 to about 15,000, an ethylene oxide content of from about 30% to about 70% by weight and a propylene oxide content of from about 30% to about 70% by weight.

In a particularly preferred embodiment an aliphatic alcohol contains from about 8 to about 16 carbon atoms and is ethoxylated to an average degree of from about 1 to about 30 moles of ethylene oxide per mole of alcohol.

Other useful nonionic surfactants for use in the present compositions are the nonionic alkylpolyglucosides. These surfactants contain straight chain or branched chain about C8 to C15, preferably from about C12 to C14, alkyl groups and have an average of from about 1 to 5 glucose units, with an average of 1

WO 93/14183

PCT/US93/00185

- 8 -

to 2 glucose units being most preferred. U.S. Patents 4,393,203 and 4,732,704, incorporated by reference, describe these surfactants.

5 An example of another suitable surfactant of the present invention is a polymeric surfactant, preferably represented by the formula:

wherein each R_1 is selected from the group consisting of hydrogen, alkyl groups containing from one to about 18 carbon atoms, acyl
10 groups containing from two to about 18 carbon atoms, $--SO_4M$, $--SO_3M$, $--COOM$, $--N(R^5)_2--O$, $--N(R^5)_3(+)$, amide groups, pyrrolidone groups, saccharide groups, and hydroxy groups in which each M is a compatible cation and each R^5 is either an alkyl or hydroxy alkyl group containing from one to about four carbon
15 atoms; wherein each R^2 or R^3 is an alkylene group containing from two to about six carbon atoms with no more than about 90% of said molecule comprising R^2 and R^3 groups containing two carbon atoms; wherein R^4 is selected from the group consisting of alkylene groups containing from one to about 18 carbon atoms and having
20 from two to about six valences, polyhydroxyalkylene oxide groups wherein each alkylene group has from one to about six hydroxy groups and contains from three to about eight carbon atoms and there are from two to about 50 hydroxyalkylene oxide groups and from two to about 50 hydroxy groups, $(=NR^2N=)$, hydrogen, $=N-(R^2NH)-x$, polyester groups containing from one to about 20
25 ester linkages and each ester group containing from about 4 to about 18 carbon atoms; wherein n is from 0 to about 500, m is for 0 to about 500, $n + m$ is for about 5 to about 1000, x is for about 2 to about 50, and y is from 1 to about 50 and equal to the valences of R^4 , wherein the molecular weight is from about 400 to about 60,000; and wherein the $-(R^2O)-$ and the $-(R^3O)-$ groups are interchangeable (as disclosed in U.S. Patent 4,904,359, incorporated herein by reference).

35

WO 93/14183

PCT/US93/00185

- 9 -

The compositions hereof may also contain a polyhydroxy fatty acid amide surfactant of the structural formula:

wherein: R^1 is H, C₁-C₄ hydrocarbyl, 2-hydroxy ethyl, 2-hydroxy propyl, or a mixture thereof, preferably C₁-C₄ alkyl, more preferably C₁ or C₂ alkyl, most preferably C₁ alkyl (i.e., methyl); and R^2 is a C₅-C₃₁ hydrocarbyl, preferably straight chain C₇-C₁₉ alkyl or alkenyl, more preferably straight chain C₉-C₁₇ alkyl or alkenyl, most preferably straight chain C₁₁-C₁₇ alkyl or alkenyl, or mixtures thereof; and Z is a polyhydroxyhydrocarbyl having a linear hydrocarbyl chain with at least 3 hydroxyls directly connected to the chain, or an alkoxyated derivative (preferably ethoxylated or propoxylated) thereof. Z preferably will be derived from a reducing sugar in a reductive amination reaction; more preferably Z is a glycityl. Suitable reducing sugars include glucose, fructose, maltose, lactose, galactose, mannose, and xylose. As raw materials, high dextrose corn syrup, high fructose corn syrup, and high maltose corn syrup can be utilized as well as the individual sugars listed above. These corn syrups may yield a mix of sugar components for Z. It should be understood that it is by no means intended to exclude other suitable raw materials. Z preferably will be selected from the group consisting of $-CH_2-(CHOH)_n-CH_2OH$, $-CH(CH_2OH)-(CHOH)_{n-1}-CH_2OH$, $-CH_2-(CHOH)_2(CHOH)_{n-2}-CH_2OH$, where n is an integer from 3 to 5, inclusive, and R' is H or a cyclic or aliphatic monosaccharide, and alkoxyated derivatives thereof. Most preferred are glycityls wherein n is 4, particularly $-CH_2-(CHOH)_4-CH_2OH$.

In Formula (I), R^1 can be, for example, N-methyl, N-ethyl, N-propyl, N-isopropyl, N-butyl, N-2-hydroxy ethyl, or N-2-hydroxy propyl.

WO 93/14183

PCT/US93/00185

- 10 -

$R^2-CO-N<$ can be, for example, cocamide, stearamide, oleamide, lauramide, myristamide, capricamide, palmitamide, tallowamide, etc.

Z can be 1-deoxyglucityl, 2-deoxyfructityl, 1-deoxymaltityl, 1-deoxylactityl, 1-deoxygalactityl, 1-deoxymannityl, 1-deoxymaltotriosityl, etc.

Methods for making polyhydroxy fatty acid amides are known in the art. In general, they can be made by reacting an alkyl amine with a reducing sugar in a reductive amination reaction to form a corresponding N-alkyl polyhydroxyamine, and then reacting the N-alkyl polyhydroxyamine with a fatty aliphatic ester or triglyceride in a condensation/amidation step to form the N-alkyl, N-polyhydroxy fatty acid amide product. Processes for making compositions containing polyhydroxy fatty acid amides are disclosed, for example, in G.B. Patent Specification 809,060, published February 18, 1959, by Thomas Hedley & Co., Ltd., U.S. Patent 2,965,576, issued December 20, 1960 to E. R. Wilson, and U.S. Patent 2,703,798, Anthony M. Schwartz, issued March 8, 1955, and U.S. Patent 1,985,424, issued December 25, 1934 to Piggott, each of which is incorporated herein by reference.

The present invention comprises any of the above described surfactants and/or mixtures thereof. Particularly preferred is anionic surfactant selected from a group consisting of linear alkyl benzene sulfonate having about 9 to 15 carbon atoms in the alkyl group, alkyl sulfate having about 8 to 22 carbon atoms, alkyl ethoxy sulfate having about 8 to 22 carbon atoms in the alkyl group and about 1 to 30 ethylene oxide units, olefin sulfonates having 8 to 22 carbon atoms, fatty acid ester sulfonate, alkyl ethoxy carboxylate, and mixtures thereof.

Oxygen Bleach

The compositions of this invention contain from about 0.005% to about 10%, preferably from about 0.01% to about 3%, most preferably from about 0.05% to about 0.5% by weight of oxygen

WO 93/14183

PCT/US93/00185

- 11 -

bleach. Preferred oxygen bleaches are hydrogen peroxide, perborates, persulfates, perphosphates, periodinates, percarbonates, peroxyulfates and mixtures thereof. Most preferred is hydrogen peroxide.

5 The amount of oxygen bleach required will depend in part upon its strength and the strength and amount of the metal sequestering agent described hereinbelow. Preferred is a ratio of anionic and nonionic surfactant to oxygen bleach of at least about 1,500:1, preferably from about 10:1 to about 1,000:1, more preferably from about 50:1 to about 500:1, most preferably from about 100:1 to about 300:1. In addition, the composition preferably has an available oxygen (AvO) level of from about 0.005% to about 2.5%, most preferably about 0.01% to about 0.5%. Lastly, the oxygen bleach of the present invention should be compatible with detergent ingredients added to form a final product.

Metal Sequestering Agent

20 The compositions of this invention also contain from about 0.001% to about 8%, preferably from about 0.005% to about 5%, most preferably from about 0.01% to about 2%, by weight of a metal sequestering (chelating) agent. The preferred sequestering agent is a water-soluble, metal sequestering agent selected from the group consisting of citric acid, tartaric acid, sodium tripolyphosphate, sodium carbonate, potassium carbonate, sodium pyrophosphate, potassium pyrophosphate, potassium tripolyphosphate, sodium hexametaphosphate, alkali metal polycarboxylates, e.g., sodium and potassium citrates, sodium and potassium tartrate, sodium and potassium ethylenediaminetetraacetate, sodium and potassium ethylenepentaacetate, sodium and potassium N-(2-hydroxyethyl)-ethylene diamine triacetates, sodium and potassium nitrilo triacetates (NTA), sodium and potassium N-(2-hydroxyethyl)-nitrilo diacetates, sodium and potassium oxydisuccinates, and sodium and potassium tartrate mono- and

WO 93/14183

PCT/US93/00185

- 12 -

di-succinates, such as described in U.S. Pat. No. 4,663,071 (Bush et al, issued May 5, 1987), incorporated herein by reference. The sequestering agent should be environmentally acceptable. A highly preferred metal sequestering agent is citric acid and its salts, i.e. sodium, potassium and ammonium.

Without being bound by theory it is believed that yellowing and darkening of the detergent composition is prevented by the metal sequestering agent binding with metals in the composition, especially iron. Without the sequestering agent, metals will react with the oxygen bleach to form hydroxide radicals. These radicals may react with the detergent surfactant to form color bodies. Therefore, a sufficient amount of sequestering agent should be present to tie up the metals, resulting in a stable colorless detergent composition.

The Optional Suds Booster

Another component which is preferably included in the composition of this invention is an auxiliary suds booster at a level of from 1% to about 20%, preferably from about 1% to about 10%, most preferably from about 2% to about 7%. Preferred suds boosters in the instant compositions are of three basic types -- betaines, amine oxide semi-polar nonionic surfactant, fatty acid amide and mixtures thereof.

The compositions of this invention can contain betaine detergent surfactants having the general formula:

wherein R is a hydrophobic group selected from the group consisting of alkyl groups containing from about 10 to about 22 carbon atoms, preferably from about 12 to about 18 carbon atoms, alkyl aryl and aryl alkyl groups containing a similar number of carbon atoms with a benzene ring being treated as equivalent to about 2 carbon atoms, and similar structures interrupted by amido or ether linkages; each R¹ is an alkyl group containing from 1 to

PCT/US93/00185

- 13 -

5

10

15

Amine oxide semi-polar nonionic surfactants comprise compounds and mixtures of compounds having the formula

30

WO 93/14183

PCT/US93/00185

- 14 -

wherein R₁ is a C₁₂₋₁₆ alkyl and R₂ and R₃ are methyl or ethyl.

Examples of the amide surfactants useful herein include the ammonia, monoethanol, and diethanol amides of fatty acids having an acyl moiety containing from about 8 to about 18 carbon atoms and represented by the general formula:

wherein R₁ is a saturated or unsaturated, aliphatic hydrocarbon radical having from about 7 to 21, preferably from about 11 to 17 carbon atoms; R₂ represents a methylene or ethylene group; and m is 1, 2, or 3, preferably 1. Specific examples of said amides are mono-ethanol coconut fatty acid amide and diethanol dodecyl fatty acid amide. These acyl moieties may be derived from naturally occurring glycerides, e.g., coconut oil, palm oil, soybean oil, and tallow, but can be derived synthetically, e.g., by the oxidation of petroleum or by hydrogenation of carbon monoxide by the Fischer-Tropsch process. The monoethanolamides and diethanolamides of C₁₂ to C₁₄ fatty acids are preferred.

The above amides and amine oxides are more fully described in U.S. Pat. No. 4,316,824 (Pancheri), incorporated herein by reference. The above betaines are more fully described in U.S. Pat. No. 4,555,360, incorporated herein by reference.

The suds boosters used in the composition of this invention can contain any one or a mixture of the suds boosters listed above.

25 The preferred sudsing characteristics of dishwashing compositions of the invention are those which will provide the user of the product with an indication of cleaning potential in a dishwashing solution. Soils encountered in dishwashing behave like suds depressants, and the presence or absence of suds from
30 the surface of a dishwashing solution is a convenient guide to product usage. Mixtures of anionic surfactants and suds boosting boosters, especially betaines and amine oxide semi polar nonionic surfactants, are preferably utilized in light duty liquid dishwashing detergent compositions of the invention because of

viscosity. Alcohols such as ethyl alcohol and propylene glycol at a level of from 0% to about 15%, potassium or sodium toluene, xylene, or cumene sulfonate at a level of from 0% to about 10% and urea at a level of from 0% to about 10% are useful.

5 Other desirable ingredients include diluents and solvents. Diluents can be inorganic salts, such as sodium sulfate, ammonium chloride, sodium chloride, sodium bicarbonate, etc., and the solvents include water, lower molecular weight alcohols, such as ethyl alcohol, isopropyl alcohol, etc. Compositions herein will
10 typically contain up to about 80%, preferably from about 30% to about 70%, most preferably from about 40% to about 65%, of water.

Various methods can be used to prepare the detergent compositions herein described. The most preferred method for preparing a final detergent product of the present invention
15 comprises:

(a) forming a colorless paste at a temperature of from about 70°F to about 180°F, preferably from about 90°F to about 130°F, the paste comprising from about 30% to about 80%, preferably from about 40% to about 70%, by weight of the paste, of anionic and
20 nonionic surfactant; from about 0.05% to about 2%, preferably from about 0.1% to about 1%, by weight of the paste, of oxygen bleach; from about 0.005% to about 5%, by weight of the paste, of metal sequestering agent; and from about 0% to about 20%, preferably from about 5% to about 15%, of alcohol; the paste having a pH
25 greater than about 7 and being substantially colorless; and

(b) adding to the paste of step (a) sufficient ingredients to form a colorless detergent composition, which is preferably a light duty liquid dishwashing composition. Anionic surfactant, particularly alkyl sulfate having about 8 to 22 carbon atoms and
30 alkyl ether sulfate having 8 to 22 carbon atoms in the alkyl group and about 1 to 30 ethylene oxide units, hydrogen peroxide, citric acid and ethanol or methanol are preferred. The benefit of making a stable, clear and colorless paste prior to forming the final product is that a desired final product is obtained faster and

35

WO 93/14183

PCT/US93/00185

- 17 -

more easily than if the components were individually added. Preferred types of detergent compositions herein are light duty liquid dishwashing detergents, liquid and granular automatic dishwashing detergents, shampoos, liquid soaps, bar soaps, and liquid and granular laundry detergents.

The above described colorless paste can alternatively be used to form granules which can then be added with other standard ingredients to make granular automatic dishwashing detergents and/or granular laundry detergent ingredients. Preferably, though, the paste is diluted with ingredients for light duty liquid dishwashing detergent compositions.

Color is evaluated using % transmittance (0-100) measured by a spectrophotometer. At a wavelength of 470 nm a clear and substantially colorless product herein measures greater than about 85%, preferably greater than about 90%, most preferably greater than about 95% transmittance.

The following examples illustrate the invention and facilitate its understanding.

EXAMPLE I

A light duty liquid dishwashing detergent composition of the present invention is as follows.

Table 1

	<u>Ingredient</u>	<u>% by weight</u>

10

15

20

A liquid dishwashing detergent of the above composition was filled into clear 22 oz. PET (polyethyleneterephthalate) bottles and placed in constant temperature rooms of 70°F, 90°F, 100°F, 120°F, and 140°F. After 6 months the compositions were evaluated for color stability and any signs of darkening, specifically yellowing. The product's color was evaluated on a Coleman Spectrophotometer model 295. The Coleman meter measures the % transmittance (0-100) of a chosen frequency of visible light through the product held in a standard glass sample vial. The wavelength of the light used in these measurements was 470 nm., which effectively measures the yellowing of products. The meter is calibrated to measure 100% transmittance through the standard vial when it contains distilled water. The sample vial is then filled with product and the sample's % transmittance read. Higher % transmittances are therefore preferred when the objective is to achieve colorless products. The results are as follows.

Table 2
Composition After 6 Months

25

30

<u>Temperature</u>	<u>% Transmittance</u> <u>(@ 470 nm)</u>
70°F	97
90°F	97
100°F	97.5
120°F	97
140°F	97

Before storage, % transmittance was about 96%. Before and after storage, the composition is nearly water-clear and colorless.

- 20 -

Surprisingly, superior color stability results are attained when both hydrogen peroxide and citric acid (Samples D and E) are used. Hydrogen peroxide alone (Sample B), especially with amine oxide in the composition (Sample H), is not as colorless as when both hydrogen peroxide and citric acid are added. Citric acid alone (Sample C), and with amine oxide (Sample G) is not as colorless as when both hydrogen peroxide and citric acid are added.

10

EXAMPLE III

Anionic paste detergent compositions of the present invention are as follows. It can be seen that hydrogen peroxide alone is not sufficient to give the desired stability. The addition of hydrogen peroxide and sequestering agent (Sample B) is necessary to maintain the desired colorlessness through the end of the first day at 180°F, which is a very extreme condition (worst case). The results are set forth in Table 4.

The sample with both hydrogen peroxide and citric acid (8) has the highest % transmittance (96) even after a day at 180°F. It is not expected that product will realistically ever be exposed to more than one day at 180°F.

What is Claimed is:

1. A stable, colorless detergent composition comprising:

(a) from 5% to 95%, by weight, of anionic or nonionic surfactant, preferably selected from the group consisting of linear alkyl benzene sulfonate having 9 to 15 carbon atoms in the alkyl group, alkyl sulfate having 8 to 22 carbon atoms, alkyl ether sulfate having 8 to 22 carbon atoms in the alkyl group and 1 to 30 ethylene oxide units, olefin sulfonates having 8 to 22 carbon atoms, fatty acid ester sulfonate, condensates of fatty acids with sarcosine, alkyl ethoxy carboxylate, alkyl glyceryl ether sulfonates having 8 to 22 carbon atoms, alkyl polyglucoside, alcohol ethoxylated with from 1 to 30 moles of ethylene oxide per mole of alcohol, polyhydroxy fatty acid amide, and mixtures thereof;

(b) from 0.005% to 10%, by weight, of oxygen bleach, preferably selected from the group consisting of hydrogen peroxide, perborates, persulfates, peroxyulphates, perphosphates, periodinates, percarbonates and mixtures thereof, most preferably hydrogen peroxide; and

(c) from 0.001% to 8% by weight, of metal sequestering agent, preferably selected from the group consisting of citric acid, tartaric acid, sodium and potassium tripolyphosphate, pyrophosphate, hexametaphosphate, alkali metal carbonate, bicarbonate, silicate, ethylenediaminetetraacetic acid, nitrilotriacetic acid, oxydisuccinic acid, mellitic acid, benzene polycarboxylic acid, maleic acid, itaconic acid, meaconic acid, fumaric acid, aconitic acid, citraconic acid, methylenemalononic acid, sodium aluminosilicate, water-soluble salts of pyrophosphate, orthophosphate, polyphosphate, phosponate, carbonate,

WO 93/14183

PCT/US93/00185

-25-

bicarbonate, silicate, and mixtures thereof, most preferably citric acid;

wherein the composition is characterized in that it has a pH between 4 and 11, a transmittance at 470 nm. of greater than 85%, and is unexpectedly stable over time and under harsh temperatures.

2. The composition according to Claim 1 wherein the anionic surfactant is selected from the group consisting of linear alkyl benzene sulfonate having 9 to 15 carbon atoms in the alkyl group, alkyl sulfate having 8 to 22 carbon atoms, alkyl ethoxy sulfate having 8 to 22 carbon atoms in the alkyl group and 1 to 30 ethylene oxide units, olefin sulfonates having 8 to 22 carbon atoms, fatty acid ester sulfonate, alkyl ethoxy carboxylate, and mixtures thereof and further comprising from 1% to 20% by weight of suds booster, preferably selected from the group consisting of betaine, amine oxide semi-polar nonionic, fatty acid amide, and mixtures thereof.

3. The composition according to Claim 1 or 2 wherein the ratio of anionic and nonionic surfactant to oxygen bleach is at least 1,500:1.

4. The composition according to any one of the preceding claims wherein the stable colorless detergent composition is selected from the group consisting of liquid and granular dishwashing detergents, liquid and granular automatic dishwashing detergents, shampoos, liquid soaps, bar soaps, and liquid and granular laundry detergents.

5. The composition according to any one of the preceding claims comprising from 0.01% to 2% of the metal sequestering agent, an available oxygen level of

WO 93/14183

PCT/US93/00185

-26-

from about 0.005% to about 2.5%, the transmittance at 470 nm is greater than about 90%, from 0.1% to 0.5% of hydrogen peroxide and wherein the ratio of anionic and nonionic surfactant to oxygen bleach is from 50:1 to 500:1.

6. A colorless detergent paste according to any one of the preceding claims comprising from 35% to 75% of alkyl sulfate and alkyl ether sulfate, from 0.1% to 1.0% of hydrogen peroxide, and from 0.005% to 5% of citric acid; the paste being substantially clear and colorless.

7. A colorless shampoo composition according to any one of the preceding claims comprising from 1% to 25% of ammonium lauryl sulfate and from 0.1% to 1% of citric acid.

8. A light duty liquid dishwashing detergent according to any one of the preceding claims comprising from 10% to 35% of alkyl ether sulfate, from 0.05% to 5% of hydrogen peroxide, from 0.01% to 2% of citric acid, and from 1% to 7% of amine oxide; the composition is characterized by being substantially clear and colorless and having a pH between 5 and 9.

9. A method of making a colorless detergent composition comprising the steps of:

(a) forming a paste at a temperature of from 70°F to 180°F, the paste comprising from 30% to 80%, preferably from 40% to 70% by weight of the paste, of anionic and nonionic surfactant; from 0.05% to 2%, preferably from 0.1% to 1% by weight of the paste, of oxygen bleach; from 0.005% to 5%, preferably from 0.01% to 2% by weight of the paste, of metal sequestering agent; and from 0% to 20%, preferably from 1% to 10% by

WO 93/14183

PCT/US93/00185

-27-

weight of the paste, of alcohol; the paste characterized by having a pH greater than 7 and being substantially colorless; and

(b) adding to the paste of step (a) sufficient ingredients to form a colorless detergent composition.

10. The method of Claim 9 wherein the colorless detergent is a light duty liquid dishwashing detergent composition comprising hydrogen peroxide, alkyl sulfate having 8 to 22 carbon atoms and alkyl ether sulfate having 8 to 22 carbon atoms in the alkyl group and 1 to 30 ethylene oxide units, citric acid, and ethanol or methanol.

11. The use of from 0.005% to 10%, by weight, of oxygen bleach, preferably selected from the group consisting of hydrogen peroxide, perborates, persulfates, peroxyulphates, perphosphates, periodinates, percarbonates and mixtures thereof, most preferably hydrogen peroxide; and

from 0.001% to 8% by weight, of metal sequestering agent, preferably selected from the group consisting of citric acid, tartaric acid, sodium and potassium tripolyphosphate, pyrophosphate, hexametaphosphate, alkali metal carbonate, bicarbonate, silicate, ethylenediaminetetraacetic acid, nitrilotriacetic acid, oxydisuccinic acid, mellitic acid, benzene polycarboxylic acid, maleic acid, itaconic acid, meaconic acid, fumaric acid, aconitic acid, citraconic acid, methylenemalononic acid, sodium aluminosilicate, water-soluble salts of pyrophosphate, orthophosphate, polyphosphate, phosponate, carbonate, bicarbonate, silicate, and mixtures thereof, most preferably citric acid; in conjunction with

WO 93/14183

PCT/US93/00185

-28-

from 5% to 95%, by weight, of anionic or nonionic surfactant, preferably selected from the group consisting of linear alkyl benzene sulfonate having 9 to 15 carbon atoms in the alkyl group, alkyl sulfate having 8 to 22 carbon atoms, alkyl ether sulfate having 8 to 22 carbon atoms in the alkyl group and 1 to 30 ethylene oxide units, olefin sulfonates having 8 to 22 carbon atoms, fatty acid ester sulfonate, condensates of fatty acids with sarcosine, alkyl ethoxy carboxylate, alkyl glyceryl ether sulfonates having 8 to 22 carbon atoms, alkyl polyglucoside, alcohol ethoxylated with from 1 to 30 moles of ethylene oxide per mole of alcohol, polyhydroxy fatty acid amide, and mixtures thereof

in the manufacture of a stable, colorless detergent composition.

12. The composition according to Claim 1 wherein said detergent composition is in a granular form.
